

# A Breed Apart

Proven Value in Transmission Line Construction

Transmission line construction benefits when the means and methods achieve **safety, productivity, and schedule**. At Maine Drilling & Blasting, we have proven the value of **blasting for pole structures compared to boring methods**. One crew probes and blasts incidental areas of rock as we progress down the power line. This achieves the fastest rock profile, while we remove occasional rock. **Probing for rock is productive with our all-terrain percussion drill**. In the significant rock areas, other drill and blast crews are quickly mobilized. **This flexible resource approach accomplishes as many holes per day as pole crews need.**
